1

### Natural Proofs

- Razborov and Rudich defined the following “natural” format for circuit lower bounds:
  - identify property  $\mathcal{P}$  of functions  $f: \{0,1\}^n \rightarrow \{0,1\}$
  - $\mathcal{P} = \cup_n \mathcal{P}_n$  is a **natural property** if:
    - (useful)  $\forall n, f_n \in \mathcal{P}_n$  implies  $f$  does not have poly-size circuits [i.e.  $f_n \in \mathcal{P}_n$  implies ckt size  $\geq s(n) \gg \text{poly}(n)$ ]
    - (constructive) can decide “ $f_n \in \mathcal{P}_n$ ?” in poly time given the *truth table* of  $f_n$
    - (large) at least  $(\frac{1}{2})^{\Omega(n)}$  fraction of all  $2^{2^n}$  functions on  $n$  bits are in  $\mathcal{P}_n$
  - show some function family  $g = \{g_n\}$  is in  $\mathcal{P}_n$

June 1, 2023 CS151 Lecture 18 2

2

### Natural Proofs

- all known circuit lower bound techniques are natural** for a suitably parameterized version of the definition

**Theorem** (RR): if there is a  $2^{n^\epsilon}$ -OWF, then there is **no natural property**  $\mathcal{P}$ .

- factoring believed to be  $2^{n^\epsilon}$ -OWF
- general version also rules out natural properties useful for proving many other separations, under similar cryptographic assumptions

June 1, 2023 CS151 Lecture 18 3

3

### Natural Proofs

- Proof:
  - main idea:** natural property  $\mathcal{P}_n$  can **efficiently distinguish**
    - pseudorandom functions** from **truly random functions**
  - but cryptographic assumption implies existence of **pseudorandom functions** for which this is impossible

June 1, 2023 CS151 Lecture 18 4

4

### Proof (continued)

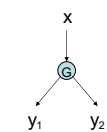

- Recall: assuming One-Way-Permutations  $f_k: \{0,1\}^k \rightarrow \{0,1\}^k$  that are not invertible by  $2^{k^\epsilon}$  size circuits
- we constructed PRG  $G: \{0,1\}^k \rightarrow \{0,1\}^{2k}$ 
  - no circuit  $C$  of size  $s = 2^{k^\delta}$  for which  $|\Pr_x[C(G(x)) = 1] - \Pr_z[C(z) = 1]| > 1/s$

(BMY construction with slightly modified parameters)

June 1, 2023 CS151 Lecture 18 5

5

### Proof (continued)

- Think of  $G$  as  $G: \{0,1\}^k \rightarrow \{0,1\}^k \times \{0,1\}^k$   
 $G(x) = (y_1, y_2)$
- Graphically:
 

```

      graph TD
        X((x)) --> G((G))
        G --> Y1((y1))
        G --> Y2((y2))
      
```

June 1, 2023 CS151 Lecture 18 6

6

### Proof (continued)

- A function  $F: \{0,1\}^k \rightarrow \{0,1\}^{2^n}$ 
  - Given  $x, i$ , can compute  $i$ -th output bit in time  $n \cdot \text{poly}(k)$

height  $n \cdot \log k$

each  $x$ , defines a poly-time computable function  $f_x$

June 1, 2023 CS151 Lecture 18 7

7

### Proof (continued)

(useful)  $\forall n f_n \in \mathbf{P}_n \Rightarrow f$  does not have poly-size circuits  
 (constructive) " $f_n \in \mathbf{P}_n$ ?" in poly time given *truth table* of  $f_n$   
 (large) at least  $(1/2)^{O(n)}$  fraction of all  $2^{2^n}$  fns. on  $n$ -bits in  $\mathbf{P}_n$

- $f_x$  in poly-time  $\Rightarrow$  for all  $x: f_x \notin \mathbf{P}_n$  (useful)
- $\Pr_g[g \in \mathbf{P}_n] \geq (1/2)^{O(n)}$  (large)
- constructive: exists circuit  $T: \{0,1\}^{2^n} \rightarrow \{0,1\}$  of size  $2^{O(n)}$  for which  $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

June 1, 2023 CS151 Lecture 18 8

8

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_0$ : pick roots of red subtrees independently from  $\{0,1\}^k$

June 1, 2023 CS151 Lecture 18 9

9

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_1$ : pick roots of red subtrees independently from  $\{0,1\}^k$

June 1, 2023 CS151 Lecture 18 10

10

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_2$ : pick roots of red subtrees independently from  $\{0,1\}^k$

June 1, 2023 CS151 Lecture 18 11

11

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_3$ : pick roots of red subtrees independently from  $\{0,1\}^k$

June 1, 2023 CS151 Lecture 18 12

12

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_4$ : pick roots of red subtrees independently from  $\{0, 1\}^k$

June 1, 2023 CS151 Lecture 18 13

13

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_5$ : pick roots of red subtrees independently from  $\{0, 1\}^k$

June 1, 2023 CS151 Lecture 18 14

14

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_6$ : pick roots of red subtrees independently from  $\{0, 1\}^k$

June 1, 2023 CS151 Lecture 18 15

15

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_7$ : pick roots of red subtrees independently from  $\{0, 1\}^k$

June 1, 2023 CS151 Lecture 18 16

16

### Proof (continued)

- $|\Pr_x[T(f_x) = 1] - \Pr_g[T(g) = 1]| \geq (1/2)^{O(n)}$

distribution  $D_{2^{n/k}-1}$ : pick roots of red subtrees independently from  $\{0, 1\}^k$

June 1, 2023 CS151 Lecture 18 17

17

### Proof (continued)

– For some  $i$ :  
 $|\Pr[T(D_i) = 1] - \Pr[T(D_{i-1}) = 1]| \geq (1/2)^{O(n)}/2^n = (1/2)^{O(n)}$

June 1, 2023 CS151 Lecture 18 18

18

### Proof (continued)

– For some  $i$ :

$$|\Pr[T(D_i) = 1] - \Pr[T(D_{i-1}) = 1]| \geq (1/2)^{O(n)}/2^n = (1/2)^{O(n)}$$

fix values at roots of all other subtrees to preserve difference

June 1, 2023 CS151 Lecture 18 19

19

### Proof (continued)

– For some  $i$ :

$$|\Pr[T(D_i') = 1] - \Pr[T(D_{i-1}') = 1]| \geq (1/2)^{O(n)}/2^n = (1/2)^{O(n)}$$

$D_i'$ : distribution  $D_i$  after fixing

June 1, 2023 CS151 Lecture 18 20

20

### Proof (continued)

– For some  $i$ :

$$|\Pr[T(D_i') = 1] - \Pr[T(D_{i-1}') = 1]| \geq (1/2)^{O(n)}/2^n = (1/2)^{O(n)}$$

$D_{i-1}'$ : distribution  $D_{i-1}$  after fixing

June 1, 2023 CS151 Lecture 18 21

21

### Proof (continued)

$$|\Pr[T(D_i') = 1] - \Pr[T(D_{i-1}') = 1]| \geq (1/2)^{O(n)}/2^n = (1/2)^{O(n)}$$

–  $C(y_1, y_2) = T(\dots)$

$$|\Pr_x[C(G(x)) = 1] - \Pr_{y_1, y_2}[C(y_1, y_2) = 1]| \geq (1/2)^{O(n)}$$

June 1, 2023 CS151 Lecture 18 22

22

### Proof (continued)

– recall: no circuit  $C$  of size  $s = 2^{k^\alpha}$  for which:

$$|\Pr_x[C(G(x)) = 1] - \Pr_{y_1, y_2}[C(y_1, y_2) = 1]| > 1/s$$

– we have  $C$  of size  $2^{O(n)}$  for which:

$$|\Pr_x[C(G(x)) = 1] - \Pr_{y_1, y_2}[C(y_1, y_2) = 1]| \geq (1/2)^{O(n)}$$

– with  $n = k^\alpha$ ,  $\alpha$  arbitrary constant

– set  $\alpha$  such that  $2^{O(n)} < s$

– contradiction.

June 1, 2023 CS151 Lecture 18 23

23

### Natural Proofs

- To prove circuit lower bounds, we must either:
  - **Violate largeness**: seize upon an incredibly specific feature of hard functions (one not possessed by a random function !)
  - **Violate constructivity**: identify a feature of hard functions that cannot be computed efficiently from the truth table
- no “non-natural property” known for all but the very weakest models...

June 1, 2023 CS151 Lecture 18 24

24

"We do not conclude that researchers should give up on proving serious lower bounds.

June 1, 2023 CS151 Lecture 18 25

25

"We do not conclude that researchers should give up on proving serious lower bounds. Quite the contrary, by classifying a large number of techniques that are unable to do the job, we hope to focus research in a more fruitful direction.

June 1, 2023 CS151 Lecture 18 26

26

"We do not conclude that researchers should give up on proving serious lower bounds. Quite the contrary, by classifying a large number of techniques that are unable to do the job, we hope to focus research in a more fruitful direction. Pessimism will only be warranted if a *long period of time* passes without the discovery of a non-naturalizing lower bound proof."

**Rudich and Razborov  
1994**

June 1, 2023 CS151 Lecture 18 27

27

### Moral

- To resolve central questions:
  - avoid relativizing arguments
    - use PCP theorem and related results
    - focus on circuits, etc...
  - avoid constructive arguments
  - avoid arguments that yield lower bounds for random functions

June 1, 2023 CS151 Lecture 18 28

28

### Course Summary

June 1, 2023 CS151 Lecture 18 29

29

### Course summary

- Time and space
  - hierarchy theorems
  - FVAL in L
  - CVAL P-complete
  - QSAT PSPACE-complete
  - succinct CVAL EXP-complete

June 1, 2023 CS151 Lecture 18 30

30

## Course summary

- Non-determinism
  - NTIME hierarchy theorem
  - “NP-intermediate” problems (Ladner’s Theorem)
  - unary languages (likely) not NP-complete
  - Savitch’s Theorem
  - Immerman-Szelepcsényi Theorem
- Problem sets:
  - *sparse* languages (likely) not NP-complete

June 1, 2023

CS151 Lecture 18

31

31

## Course summary

- Non-uniformity
  - formula lower bound (Andreev, Hastad)
  - monotone circuit lower bound (Razborov)
- Problem sets:
  - Barrington’s Theorem
  - formula lower bound for parity

June 1, 2023

CS151 Lecture 18

32

32

## Course summary

- Randomness
  - polynomial identity testing + Schwartz-Zippel
  - unique-SAT (Valiant-Vazirani Theorem)
  - Blum-Micali-Yao PRG
  - Nisan-Wigderson PRG
  - worst-case hardness  $\Rightarrow$  average-case hardness
  - Trevisan extractor
- Problem sets:
  - Goldreich-Levin hard bit

June 1, 2023

CS151 Lecture 18

33

33

## Course summary

- Alternation
  - QSAT<sub>1</sub> complete for levels of the PH
  - Karp-Lipton theorem
  - BPP in PH
- Problem sets:
  - approximate counting + sampling with an NP-oracle
  - VC-dimension is  $\Sigma_3$ -complete
  - the class  $\Sigma_2^P$  (final)

June 1, 2023

CS151 Lecture 18

34

34

## Course summary

- Counting
  - #matching is #P-complete
- Problem sets:
  - permanent is #P-complete
  - Toda’s theorem:  $PH \subseteq P^{\#P}$

June 1, 2023

CS151 Lecture 18

35

35

## Course summary

- Interaction
  - IP = PSPACE
  - GI in  $NP \cap coAM$
  - using NW PRG for MA, variant for AM
  - hardness of approximation, PCPs
  - elements of the PCP theorem
- Problem sets:
  - BLR linearity test
  - Clique hard to approximate to within  $N^\epsilon$

June 1, 2023

CS151 Lecture 18

36

36

## Course summary

- Barriers to progress
  - oracles rule out relativizing proofs
  - “natural proofs” rule out many circuit lower bound techniques

June 1, 2023

CS151 Lecture 18

37

37

## Course summary

- Time and space **L, P, PSPACE, EXP**
- Non-determinism **NL, NP, coNP, NEXP**
- Non-uniformity **NC, P/poly**
- Randomness **RL, ZPP, RP, coRP, BPP**
- Alternation **PH, PSPACE**
- Counting **#P**
- Interaction **IP, MA, AM, PCP[log n, 1]**

June 1, 2023

CS151 Lecture 18

38

38

## The big picture

- All classes on previous slide are probably distinct, except:
  - **P, ZPP, RP, coRP, BPP** (probably all equal)
  - **L, RL** (probably all equal; **NL?**)
  - **NP, MA, AM** (probably all equal)
  - **IP = PSPACE**
  - **PCP[log n, 1] = NP**
- Only real separations we know separate classes delimiting same resource:
  - e.g. **L ≠ PSPACE, NP ≠ NEXP**

June 1, 2023

CS151 Lecture 18

39

39

## The big picture

Remember:

possible explanation for failure to prove conjectured separations...

...is that they are false

June 1, 2023

CS151 Lecture 18

40

40

## The big picture

- Important techniques/ideas:
  - simulation and diagonalization
  - reductions and completeness
  - self-reducibility
  - encoding information using low-degree polynomials
  - randomness
  - others...

June 1, 2023

CS151 Lecture 18

41

41

## The big picture

- I hope you take away:
  - an ability to extract the **essential features** of a problem that make it **hard/easy**...
  - knowledge and tools to **connect** computational problems you encounter with **larger questions** in complexity
  - **background needed to understand** current research in this area

June 1, 2023

CS151 Lecture 18

42

42

## The big picture

– background to *contribute* to current research in this area

- many open problems
- young field
- try your hand...
