

CS184a: Computer Architecture (Structure and Organization)

Day 14: February 7, 2005
Interconnect 2: Wiring
Requirements and Implications

Previously

- Need for Interconnect
- Why simplest things don't work
 - Bus
 - Crossbar
- Need to understand/exploit structure in our interconnect problem

Today

- Wiring Requirements
- Rent's Rule
 - A model of structure
- Implications

Wires and VLSI

- Simple VLSI model
 - Gates have fixed size (A_{gate})
 - Wires have finite spacing (W_{wire})
 - Have a small, finite number of wiring layers
 - *E.g.*
 - one for horizontal wiring
 - one for vertical wiring
 - Assume wires can run over gates

Visually: Wires and VLSI

Important Consequence

- A set of wires
- crossing a line
- take up space:

$$W = (N \times W_{wire}) / N_{layers}$$

Thompson's Argument

- The minimum area of a VLSI component is bounded by the larger of:
 - The area to hold all the gates
 - $A_{\text{chip}} \geq N \times A_{\text{gate}}$
 - The area required by the wiring
 - $A_{\text{chip}} \geq N_{\text{horizontal}} W_{\text{wire}} \times N_{\text{vertical}} W_{\text{wire}}$

Caltech CS184 Winter2005 --DeHon

7

How many wires?

- We can get a **lower bound** on the total number of horizontal (vertical) wires by considering the **bisection** of the computational graph:
 - Cut the graph of gates in half
 - Minimize connections between halves
 - Count number of connections in cut
 - Gives a lower bound on number of wires

Caltech CS184 Winter2005 --DeHon

8

Bisection

Caltech CS184 Winter2005 --DeHon

9

Next Question

- In general, if we:
 - Cut design in half
 - Minimizing cut wires
- How many wires will be in the bisection?

Caltech CS184 Winter2005 --DeHon

10

Arbitrary Graph

- Graph with N nodes
- Cut in half
 - $N/2$ gates on each side
- **Worst-case:**
 - Every gate output on each side
 - Is used somewhere on other side
 - Cut contains N wires

Caltech CS184 Winter2005 --DeHon

11

Arbitrary Graph

- For a random graph
 - Something proportional to this is likely
- That is:
 - Given a random graph with N nodes
 - The number of wires in the bisection is likely to be: $c \times N$

Caltech CS184 Winter2005 --DeHon

12

Particular Computational Graphs

- Some important computations have exactly this property
 - FFT (Fast Fourier Transform)
 - Sorting

Caltech CS184 Winter2005 --DeHon

13

FFT

Ca

FFT

- Can implement with $N/2$ nodes
 - Group row together
- Any bisection will cut $N/2$ wire bundles
 - True for any reordering

Caltech CS184 Winter2005 --DeHon

Assembling what we know

- $A_{\text{chip}} \geq N \times A_{\text{gate}}$
- $A_{\text{chip}} \geq N_{\text{horizontal}} W_{\text{wire}} \times N_{\text{vertical}} W_{\text{wire}}$
- $N_{\text{horizontal}} = c \times N$
- $N_{\text{vertical}} = c \times N$
 - [bound true recursively in graph]
- $A_{\text{chip}} \geq cN W_{\text{wire}} \times cN W_{\text{wire}}$

Caltech CS184 Winter2005 --DeHon

16

Assembling ...

- $A_{\text{chip}} \geq N \times A_{\text{gate}}$
- $A_{\text{chip}} \geq cN W_{\text{wire}} \times cN W_{\text{wire}}$
- $A_{\text{chip}} \geq (cN W_{\text{wire}})^2$
- $A_{\text{chip}} \geq N^2 \times c'$

Caltech CS184 Winter2005 --DeHon

17

Result

- $A_{\text{chip}} \geq N \times A_{\text{gate}}$
- $A_{\text{chip}} \geq N^2 \times c'$
- Wire area grows faster than gate area
- Wire area grows with the square of gate area
- For sufficiently large N ,
 - Wire area dominates gate area

Caltech CS184 Winter2005 --DeHon

18

Intuitive Version

- Consider a region of a chip
- Gate capacity in the region goes as area (s^2)
- Wiring capacity into region goes as perimeter ($4s$)
- Perimeter grows more slowly than area
 - Wire capacity saturates before gate

Caltech CS184 Winter2005 --DeHon

Result

- $A_{\text{chip}} \geq N^2 \times c'$
- Wire area grows with the square of gate area
- Troubling:
 - To **double** the size of our computation
 - Must **quadruple** the size of our chip!

Caltech CS184 Winter2005 --DeHon

20

So what?

What do we do with this observation?

Caltech CS184 Winter2005 --DeHon

21

First Observation

- Not all designs have this large of a bisection
- What is typical?

Caltech CS184 Winter2005 --DeHon

22

Array Multiplier

Caltech CS184 Winter2005 --DeHon

23

Shift Register

Caltech CS184 Winter2005 --DeHon

24

Architecture \leftrightarrow Structure

- Typical architecture trick:
 - exploit expected problem structure
- What structure do we have?
- Impact on resources required?

Caltech CS184 Winter2005 --DeHon

25

Bisection Bandwidth

- Bisection bandwidth of design
 - lower bound on network bisection bandwidth
 - important, **first order** property of a design.
 - Measure to characterize
 - Rather than assume worst case
- Design with more locality
 - lower bisection bandwidth
- Enough?

Caltech CS184 Winter2005 --DeHon

Characterizing Locality

- Single cut not capture locality within halves
- Cut again
 - recursive bisection

Caltech CS184 Winter2005 --DeHon

27

Regularizing Growth

- How do bisection bandwidths shrink (grow) at different levels of bisection hierarchy?
- Basic assumption: Geometric
 - 1
 - $1/\alpha$
 - $1/\alpha^2$

Caltech CS184 Winter2005 --DeHon

28

Geometric Growth

- (F, α) -bifurcator
 - F bandwidth at root
 - geometric regression α at each level

Caltech CS184 Winter2005 --DeHon

29

Good Model?

Log-log plot \rightarrow straight lines represent geometric growth

Caltech CS184 Winter2005 --DeHon

30

Rent's Rule

- In the world of circuit design, an empirical relationship to capture:

$$IO = c N^p$$

- $0 \leq p \leq 1$
- p – characterizes interconnect richness
- Typical: $0.5 \leq p \leq 0.7$
- “High-Speed” Logic $p=0.67$

Caltech CS184 Winter2005 --DeHon

31

Rent's Rule

- In the world of circuit design, an empirical relationship to capture:

$$IO = c N^p$$

- compare (F, α) -bifurcator
 $\alpha = 2^p$

Caltech CS184 Winter2005 --DeHon

32

Rent and Locality

- Rent and IO capture/quantifying locality
 - local consumption
 - local fanout

Caltech CS184 Winter2005 --DeHon

33

What tell us about design?

- Recursive bandwidth requirements in network

Caltech CS184 Winter2005 --DeHon

34

As a function of Bisection

- $A_{\text{chip}} \geq N \times A_{\text{gate}}$
- $A_{\text{chip}} \geq N_{\text{horizontal}} W_{\text{wire}} \times N_{\text{vertical}} W_{\text{wire}}$
- $N_{\text{horizontal}} = N_{\text{vertical}} = IO = cN^p$
- $A_{\text{chip}} \geq (cN)^{2p}$
- If $p < 0.5$

$$A_{\text{chip}} \propto N$$

- If $p > 0.5$

$$A_{\text{chip}} \propto N^{2p}$$

Caltech CS184 Winter2005 --DeHon

35

In terms of Rent's Rule

- If $p < 0.5$, $A_{\text{chip}} \propto N$
- If $p > 0.5$, $A_{\text{chip}} \propto N^{2p}$

- Typical** designs have $p > 0.5$
→ **interconnect dominates**

Caltech CS184 Winter2005 --DeHon

36

What tell us about design?

- Recursive bandwidth requirements in network
 - **lower bound** on resource requirements
- N.B. **necessary** but not **sufficient** condition on network design
 - *i.e.* design must also be able to *use* the wires

Caltech CS184 Winter2005 --DeHon

37

What tell us about design?

- Interconnect lengths
 - Intuition
 - if $p > 0.5$, everything cannot be nearest neighbor
 - as p grows, so wire distances

Can think of p as dimensionality:
 $p = 1 - 1/d$

Caltech CS184 Winter2005 --DeHon

38

Interconnect Lengths

- Side is \sqrt{N}
- IO crossing it is N^p
- What's minimum length for longest wires?

Caltech CS184 Winter2005 --DeHon

39

What tell us about design?

- Interconnect lengths (more general)
 - $IO = (n^2)^p$ crossing distance n
 - end at exactly distance n :

$$\frac{\partial(IO)}{\partial n}$$

Caltech CS184 Winter2005 --DeHon

What tell us about design?

- $E(\text{length}) =$
 - $1 \times (\text{number at length 1}) + 2 \times (\text{number at length 2}) + 3 \times (\text{number at length 3}) \dots$

$$E(\text{length}) = \int_0^{n=\sqrt{N}} n \times (\text{Number}(n)) \partial n$$

$$\text{Number}(n) = \frac{\partial(IO)}{\partial n}$$

Assume iid sources;
Equally likely to originate at any point in area.

Caltech CS184 Winter2005 --DeHon

41

Math

$$\frac{d(IO)}{dn} = \frac{d(cn^{2p})}{dn} = 2pcn^{2p-1}$$

$$\int_0^{\sqrt{N}} \left(\frac{n \times \frac{d(IO)}{dn}}{n^2} \right) dn$$

$$\int_0^{\sqrt{N}} \left(\frac{n \times 2pcn^{2p-1}}{n^2} \right) dn$$

Caltech CS184 Winter2005 --DeHon

42

Math continued

$$\int_0^{\sqrt{N}} \left(\frac{n \times 2pcn^{2p-1}}{n^2} \right) dn$$

$$\int_0^{\sqrt{N}} \left(\frac{2pcn^{2p-1}}{n} \right) dn$$

$$\int_0^{\sqrt{N}} (2pcn^{2p-2}) dn$$

Caltech CS184 Winter2005 --DeHon

43

Math continued

$$\int_0^{\sqrt{N}} (2pcn^{2p-2}) dn$$

$$\left(\frac{2pcn^{2p-1}}{2p-1} \right) \Big|_0^{\sqrt{N}}$$

Caltech CS184 Winter2005 --DeHon

44

Math Continued

$$\left(\frac{2pcn^{2p-1}}{2p-1} \right) \Big|_0^{\sqrt{N}}$$

$$\left(\frac{2pc}{2p-1} \right) (N^{0.5})^{2p-1}$$

$$\left(\frac{2pc}{2p-1} \right) (N^{p-0.5})$$

Caltech CS184 Winter2005 --DeHon

45

What tell us about design?

- Interconnect lengths

- IO=(n²)^p cross distance n

- at exactly distance n:

$$E(\text{length}) = \int_0^{\sqrt{N}} n \times \left(\frac{\partial(\text{IO})}{\partial n} \right) \frac{\partial(\text{IO})}{\partial n} dn$$

- E(length)=Ω(N^(p-0.5))

- p>0.5

True even with multiple metal layers.

Caltech CS184 Winter2005 --DeHon

Recall from Day 6

Delays

- Logical capacities growing

- Wirelengths?

- No locality → κ

- Rent's Rule

- L → n^(p-0.5)

- [p>0.5]

Caltech CS184 Winter2005 --DeHon

Capacity

- Rent: IO=C*N^p

- p>0.5

- A= C*N^{2p}

- N=(A/C)^(1/2p)

- Logical Area → κ²

- N'=((κ²A)/C)^(1/2p)

- N'=(A/C)^(1/2p) × (κ²)^(1/2p)

- N'=N × (κ²)^(1/2p)

- N'=N × (κ)^(1/p)

- Sanity Check

- p=1

- N₂ = κN

- p~0.5

- N₂ ~ κ²N

Caltech CS184 Winter2005 --DeHon

48

Capacity (alternate)

- Rent: $IO = C * N^p$
- $p > 0.5$
- $A = C * N^{2p}$
- Logical Area $\rightarrow \kappa^2$
 - $\kappa^2 A = C * N_2^{2p}$
 - $\kappa^2 C * N_1^{2p} = C * N_2^{2p}$
 - $\kappa^2 N_1^{2p} = N_2^{2p}$
 - $\kappa N_1^p = N_2^p$
 - $N_2 = \kappa^{(1/p)} N_1$
- Sanity Check
 - $p = 1$
 - $N_2 = \kappa N$
 - $p = 0.5$
 - $N_2 \sim \kappa^2 N$

Caltech CS184 Winter2005 --DeHon

49

What tell us about design?

- $IO \propto N^p$
- Bisection $BW \propto N^p$
- side length $\propto N^p$
 - N if $p < 0.5$
- Area $\propto N^{2p}$
 - $p > 0.5$
- Average Wire Length $\propto N^{(p-0.5)}$
 - $p > 0.5$

N.B. 2D VLSI world has "natural" Rent of $P=0.5$ (area vs. perimeter)

Caltech CS184 Winter2005 --DeHon

50

Rent's Rule Caveats

- Modern "systems" on a chip -- likely to contain subcomponents of varying Rent complexity
- Less I/O at certain "natural" boundaries
- System close
 - (Rent's Rule apply to workstation, PC, PDA?)

Caltech CS184 Winter2005 --DeHon

51

Area/Wire Length

- Bad news
 - Area $\sim \Omega(N^{2p})$
 - faster than N
 - Avg. Wire Length $\sim \Omega(N^{(p-0.5)})$
 - grows with N
- Can designers/CAD control p (locality) once appreciate its effects?
- I.e. maybe this cost changes design style/criteria so we mitigate effects?

Caltech CS184 Winter2005 --DeHon

52

What Rent didn't tell us

- Bisection bandwidth purely geometrical
- No constraint for delay
 - I.e. a partition may leave critical path weaving between halves

Caltech CS184 Winter2005 --DeHon

53

Critical Path and Bisection

Minimum cut may cross critical path multiple times. Minimizing long wires in critical path \rightarrow increase cut size.

Caltech CS184 Winter2005 --DeHon

54

Rent Weakness

- Not account for path topology
- ? Can we define a "Temporal" Rent which takes into consideration?
 - Promising research topic

Big Ideas [MSB Ideas]

- Rent's rule characterize locality
 - Fixed wire layers:
 - Area growth $\Omega(N^{2p})$
 - Wire Length $\Omega(N^{(p-0.5)})$
- $p > 0.5 \rightarrow$ interconnect growing faster than compute elements
 - expect interconnect to dominate other resources
